us</h1>

    <p style="font-family: Verdana, Geneva, Tahoma, sans-
serif;fontsize: large;">Retailers worldwide have started deploying
smart service innovations in their stores to regain market share
lost to online competitors. Against this backdrop, this paper
focuses on the design of product recommendation systems for
fashion stores. Our research particu
larly aims at answering the issues of whether and to what extent (i)
the sensing capabilities of smar
t fashion retail environments and (ii) the integration of contextual
information can improve the quality of such recommendations. To
this end, we consider smart fitting
rooms with the ability to detect prod
ucts and customers as a showcase; a transaction dataset from a
leading German fashion retailer; and contextual information about the
time of purchase, the store type, and the weather conditions. Our pr
eliminary analyses indicate that sensor information regarding garment
and user identification, as well
as further context data help to improve product
recommendations in fashion stores.
